Customize the SMTP domain

Introduction

The SMTP interface of eComFax allows you to send fax or SMS jobs directly from an email client. To do this, a set of subdomains is used to direct the mail based on the type of work that you want to send:

- Fax
- Fax with Cover Page
- SMS

Generic e-mail subdomains of eComFax are respectively:

- fax.ecomfax.com
- faxp.ecomfax.com
- sms.ecomfax.com

By customizing the SMTP domain of eComFax it is possible to facilitate the user experience since users of a company can use their own domain to address fax or SMS jobs. This document explains the steps necessary to make this customization.

New MX registers

MX records are DNS (Domain Name System) entries used to exchange emails. To customize eComFax SMTP domains, just add new MX entries in the public DNS server of a domain, one for each type of work, according to the relationship explained in the previous point.

All MX entries must point to the same host: **fax.ecomfax.com**

Example

Let's assume that the company **XYZ Corporation** has as domain of mail **xyz.com**. To customize the eComFax domains, choose the following prefixes:

- Fax without cover page: fax
- Fax with cover page: faxp
- SMS: sms

The list of MX entries required in your Internet DNS server will be:

MX entry	Host
fax.xyz.com	fax.ecomfax.com
faxp.xyz.com	fax.ecomfax.com
sms.xyz.com	fax.ecomfax.com

Communication of the new domains to CWS

In order for the personalized mail domains to be recognized by the eComFax platform, it is essential to notify the new MX records to CWS. This notification is manual and can be done through the commercial manager of your account.

Customer experience

After the personalization of the domains, a user of XYZ Corporation can send a fax or SMS job from his email by filling in the "To:" field as follows:

Type of task	"To:" field contains
Fax	1917498720@fax.xyz.com
Fax with cover	1917498720@faxp.xyz.com
SMS	1612345678@sms.xyz.com
